CONCLUSION

THE PRESENT STUDY CONCLUDES

1. Combination of 5% doxycycline and 0.2% chlorhexidine is a more effective irrigant among the experimental groups against *E. faecalis*.

2. Combination of 5% doxycycline and 2.5% sodium hypochlorite did not show as good result as the combination of 5% doxycycline and 0.2% chlorhexidine.

3. Antimicrobial efficacy of 5% doxycycline is comparable to the combination of 5% doxycycline and 2.5% sodium hypochlorite.

4. 2.5% sodium hypochlorite showed the least antibacterial effect against *E. faecalis*.

5. 0.2% chlorhexidine gluconate was better than 2.5% sodium hypochlorite against *E. faecalis*.
